

Description

The Net2Air Ethernet bridge provides the wireless communication link between the PC running Net2 software and Net2 nano control units. Unlike the Net2Air USB bridge, the Ethernet bridge uses the site's LAN/WAN. This means that multiple Ethernet bridges can be placed around a site and linked back to the PC via LAN/WAN. Net2 nano control units can therefore be installed at a greater distance away from the PC running Net2 software.

Features

- Wireless link from a Net2 PC to Net2 nano control units
- Plugs into the existing LAN/WAN
- Multiple Ethernet bridges can be placed around a site
- Gives more flexibility on placing Net2 nano control units
- Power over Ethernet
